Examiner's Statement of Reasons for Allowance

1. The following is an examiner's statement of reasons for allowance. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Allowable Subject Matter

2. Claims 1-12 are allowed. Claims 1-12 describe a method of manufacturing a dispersion flattened fiber with high negative dispersion ranging from -20 ps/nm/km to -60 ps/nm/km comprising the steps of preparing a silica tube, cleaning the silica tube, forming a cladding on an inner peripheral surface of the silica tube, forming a first ring-type core on an inner peripheral surface of the cladding, forming a first low refractive region on an inner peripheral surface of the first ring-type core, wherein the refractive index of the first low refractive region is lower than that of the cladding, forming a second ring-type core on an inner peripheral surface of the first low refractive region, forming a second low refractive region on an inner peripheral surface of the second ring-type core, wherein the refractive index of the second low refractive region is lower than that of the cladding, forming a central core on an inner peripheral surface of the second low refractive region, heating the silica tube, thereby forming a perform of the dispersion flattened fiber and extracting the dispersion flattened fiber from the perform.

3. U.S. Patent No. 4,372,648 to Black describes a method of manufacturing an on optical fiber comprising the steps of forming a cladding on an inner peripheral surface of a silica tube, forming a first ring-type core on an inner peripheral surface of the cladding, forming a first low refractive region on an inner peripheral surface of the first ring-type core, wherein the refractive

Art Unit: 2874

index of the first low refractive region is lower than that of the cladding, forming a central core on an inner peripheral surface of the second low refractive region and heating the silica tube, thereby forming a perform of the dispersion flattened fiber.

4. Black does not describe preparing a silica tube, cleaning the silica tube, forming a second ring-type core on an inner peripheral surface of the first low refractive region, forming a second low refractive region on an inner peripheral surface of the second ring-type core, wherein the refractive index of the second low refractive region is lower than that of the cladding or extracting the fiber from the perform. Further, Black does not describe the fiber as a dispersion flattened fiber with high negative dispersion ranging from -20 ps/nm/km to -60 ps/nm/km.

5. U.S. Patent No. 4,372,648 to Black remains the closest prior art of record in this application. For the reasons stated above, however, Claims 1-12 herein are deemed to patentably distinguish over Black and all other prior art of record.

Conclusion

6. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. U.S. Patents Nos. 4,265,515 to Kao, 4,327,965 to Black, 5,942,296 to Oh et al. and 6,280,850 to Oh et al. describe methods of manufacturing optical fibers. U.S. Patent No. 6,317,552 to Berkey describes a dispersion flattened fiber with high negative dispersion ranging from -20 ps/nm/km to -60 ps/nm/km.
